

Features Request 07-21 — Response

Disposition of all 10 items · 8 fixed · 2 diagnosed → backend

Prepared for the QA team · generated 2026-07-22

Features Request 07-21 — Response

Thanks for the detailed round — the API captures and screenshots were especially useful. **8 items are fixed** in this build, and **2 (sync speed)** are diagnosed and handed to the backend pass. Legend:  Fixed ·  Resolved (guidance) ·  Diagnosed → backend.

Notifications — its own page + redesign

3 & 4.  Notifications is now a standalone page. It no longer lives inside My Competencies, so it carries **no "My Competencies" header and no nav bar** — just a "Notifications" page with its own header. Reached from the account menu (and the phone "More" sheet).

5.  Redesigned the Notifications page. A single, cohesive page now: a page intro, then **"How you're notified"** (delivery threshold + channels + phone verification) and **"My alerts"** below. The big change is the empty **My alerts** area — instead of a large empty box, it now shows **one-click starter templates** (Urgent tickets · Escalations · A category) plus a "build from scratch" option, so the space is used and the feature is discoverable. Once you have alerts they render as compact cards, with Quiet hours in its own row.

6.  Removed the nav bar from My Skills. The My Competencies page no longer shows the tab bar; the archived **IT Summit** view is reachable via a small header pill instead.

Public API

7.  Lookup by ticket reference works (no more 500). `GET /api/v1/tickets/TP-1048` (and `#233976`) now resolve to the ticket — a numeric id still means the internal id, and a visible ref resolves via the ref resolver. An unknown ref returns a clean **404**, never a

1. This applies to all `/tickets/:id` routes (get, update, replies, notes, tasks, ...).

8.  Pagination now returns a cursor. The list endpoint defaults to cursor pagination, so the response includes a `next_cursor` (and `total`). Follow it with `?cursor=<next_cursor>` for the next page; pass `?page=N` if you prefer offset paging.

Email delivery health

10.  The health card is under Settings → Notifications — now easy to find. Last round Settings was a long unsorted list; it's now **grouped and alphabetized**, and the **Notifications** item lives under the **"Notifications & Public"** group, with the **Email delivery health** card at the top of that page. (Note: that page is admin-scoped — if

you don't see a "Notifications" item under Settings, it's a role/permission level, not a missing feature; let us know and we'll check your access.)

Testing aid

9.  Concurrent idempotency (4.5.3). Firing two requests at the exact same instant is hard by hand — here's a one-liner (PowerShell) that fires two identical POSTs in parallel with the same `Idempotency-Key`; you should get **one** ticket created and a **409** `idempotency_in_flight` on the other:

```
$h = @{ Authorization = "Bearer tp_live_..."; "Idempotency-Key" = "qa-conc-1"; "Content-Type"="application/json"
$b = '{"subject":"QA TEST concurrent","requesterEmail":"you@bgcengineering.ca"}'
1..2 | ForEach-Object { Start-Job { param($u,$h,$b) Invoke-WebRequest -Uri $u -Method Post -Headers $h -Body $b }
```

Sync speed — diagnosed, in progress with backend

1.  Tech schedules take a few minutes to appear. and **2.  Agent list is slow after a workspace switch.**

These are the same class as last round's sync-latency items — the data is populated by the FreshService/Entra sync, and we're addressing them in the dedicated backend sync pass (adding faster first-load paths + visible sync status) rather than turning up the sync cadence, which risks FreshService rate-limit stalls.

All fixed items ship together in the next preview build. Full test suite green (backend 807/807, frontend 82/82).
