

All 13 items addressed

Every item from the 07-06 request is fixed or built in **v3.0.4-preview**, including a full root-cause investigation of the #231648 incident (item 13 — see the amber card). The build is verified on dev (624 backend + 60 frontend tests, screenshot-checked on desktop and 390-px mobile) and is ready to deploy to production on your go-ahead. Two small database migrations ship with it (both additive).

1 Remove Mail Workflows from Settings

DONE

The Settings tab is gone — Mail Workflows now lives only on the homepage main tab. Old bookmarks to the Settings section redirect to the main Workflows page instead of dead-ending.

2 Change status directly on the ticket queue

DONE

The Status column is now a dropdown on every editable row. Ticket-Pulse-born tickets get a lightweight in-menu confirm; FreshService-born tickets go through the usual “sync to FreshService” confirmation, exactly like assignee changes.

3 Toast notification with Undo after a change

DONE

Instant edits (status, priority, category — on the queue and on the ticket page) now show a toast with an Undo button for ~5 seconds. Undo re-applies the previous value through the same audited path.

4 Requester email replies not appearing in Ticket Pulse

FIXED

“FreshService gets the reply right away, but Ticket Pulse doesn’t seem to pick up the reply.”

Root cause: the reconcile job that imports FreshService conversations onto TP-born tickets existed but was never scheduled — replies only appeared after certain manual actions.

- A background reconcile now runs every ~3 minutes over open TP-born tickets and imports new requester replies (read-only against FreshService — it never writes).
- Opening a ticket also refreshes it on the spot, for both origins — FreshService-born tickets pull their latest thread on open.
- Imported replies fire the same workflow triggers as native ones, so “requester replied” automations work regardless of where the reply landed first.

5 Can't change category back to Uncategorized

FIXED

Root cause: clearing the category left the legacy AI-assessment skill fields set, and the UI fell back to them — so the category “reappeared”. Clearing now wipes both in lockstep; Uncategorized sticks, including after an AI assessment.

6 Odd spacing between subject / type / category

FIXED

Root cause: the Type column was narrower than the INC/REQ pill itself, so the pill overflowed and sat flush against the category text while a large gap remained after the subject. The column widths are rebalanced — every column now has the same breathing room.

7 Vahid, Soheil, Mo, Sam, Susan missing from approval managers

FIXED

“Is it because we are admins?”

Exactly right — the picker (and a backend guard) only allowed workspace *technicians*, and the five of you are app admins, not technicians. Both restrictions are removed: the picker now searches the whole BGC directory (members listed first, directory matches labelled), and anyone with an email can be a manager — decisions work via the emailed link for everyone, and in-app for anyone who can sign in.

8 Show more by default; don't hide the description

DONE

Descriptions now render in full by default. Only genuinely long ones (taller than roughly two screens of content, measured on the rendered layout — not character count) collapse, and even then to a generous preview with [Show more](#). Small and medium emails are never clipped.

9 Images attached to the description should show with it

DONE

Images attached to the description now appear as a clickable thumbnail strip directly under the description text (click opens the zoomable preview). Where the email HTML embeds images that can actually load, they still render inline; broken `cid:` references from email clients are cleaned up instead of showing a broken-image icon. The attachments rail on the right stays as the complete list.

10 “Templates” button exceeds the screen on mobile

FIXED

The composer toolbar now wraps and uses compact labels on phones, and the dropdown panels clamp to the viewport — nothing extends past the screen edge anymore.

11 Bottom nav bar disappears on the Tickets page (mobile)

FIXED

The Dashboard / Tickets / Timeline / Analytics / More bar now shows on the Tickets list, the ticket page and the new-ticket form. Toasts float above it and the sticky “Create ticket” bar stacks neatly on top of it.

New in **Settings** → **Ticket Ops** → **Quick notes**: create named notes, scope each one to one or more top categories (or leave unscoped to show everywhere), edit / disable / delete any time. In the composer’s *Internal note* mode an amber Quick notes button lists the ones matching the ticket’s category — one click inserts the text.

Ready to paste for Gaby (nothing is pre-seeded — add these under Settings → Ticket Ops):

- 1 · “The upgrade was ordered + screen protector + case.”
- 2 · “The person was ported from personal to corp account, the phone was ordered + screen protector + case.”
- 3 · “They are getting the second phone, the phone was ordered + screen protector + case.”

13 #231648 — “network error” on resolve, yet two resolved emails

INVESTIGATED & FIXED

What actually happened (from prod data):

- Your resolve request reached FreshService, but the write-back took longer than the app’s 30-second limit — the app gave up and showed “network error” while FreshService was still applying the change. It then *succeeded* in the background, twice (one per attempt).
- The two “ticket resolved” emails came **from FreshService itself**, reacting to the resulting Resolved → Open → Resolved churn. Ticket Pulse sent nothing — its notification provider on prod recorded exactly one (mocked) delivery for that workflow.
- “Resolved” is the correct status — nothing about Resolved vs Closed contributed.

Fixes so it can’t recur: FreshService write-backs now get a proper 90-second window; repeating the same status is a no-op (no second transition, no second FreshService email); any failed write-back refetches the ticket so the UI shows the true state instead of a misleading error; and slow write-backs are logged for monitoring.
