

Features Request 07-16 — Response

All five items from the July 16 QA review are now addressed and shipped to production — including the two big features (Tasks and parent/child tickets) you asked us to design first, which we built after your go-ahead. Item 2 (Susan's missing email) is a diagnosis with a delivery test we still need Susan to confirm. We've also folded in one more feature shipped this week — **Custom Agent Alerts** — for your awareness and testing (see the end of this doc).

Shipped in v3.0.65 → v3.0.67-preview

PRs #177 · #178 · #179

July 16, 2026

Deployed & verified in prod

At a glance

#	REQUEST	STATUS
1	"Assigned by" icons extend outside the boxes on a laptop screen	SHIPPED
2	Approver (Susan Xu) received no email despite "email approver" checked	DIAGNOSED · NEEDS SUSAN
3	Add a "Tasks" tab — assign a task to an agent + notify (TP & FS)	SHIPPED
4	Parent / child tickets (assignable children)	SHIPPED
5	Can't merge a FreshService ticket into a Ticket Pulse ticket; search weak	SHIPPED
+	Custom Agent Alerts (from agent feedback) — for awareness & testing	SHIPPED

1 Dashboard rows now fit on laptop screens

You asked: on a laptop screen, the “Assigned by” icons at the very right extend outside the boxes.

The dashboard’s compact technician table was laid out for a 1920-wide desktop — its columns added up to a fixed ~1220px, so on a 1366–1536px laptop the rightmost cells (the assigner icons and CSAT) pushed past the right edge of each row card.

Before: the assigner icons run past the right edge of the row on a laptop.

Fixed: the table now compresses its columns at 1536px and below (name, weekly heatmap, and each metric column tighten up), so everything stays inside the row card on laptops. Wide desktop monitors are unchanged.

2 Susan’s missing approval email — what we found, and a test for you

You asked: I selected “email approver”, but as the approver I received no email and nothing was in Junk. Maybe Susan’s email is wrong?

Good questions, and here’s where we landed after checking the production email system:

- **The email address is correct.** The approval requests were sent to `sxu@bgcengineering.ca`, which matches Susan’s account exactly — no typo.
- **The pipeline is confirmed working.** We verified end-to-end on July 14 that the approval-email path sends successfully (Vahid received the test), and we re-tested today against production. So the code is doing its job.
- **We could not read SendGrid’s suppression lists** (the production API key is scoped for sending only, not admin) — so we can’t yet rule out that Susan’s address landed on a bounce/block list at the mail provider. That’s the most likely remaining explanation given the pipeline works and the address is right.

Action for Susan — one quick test: we just sent a delivery test straight to `sxu@bgcengineering.ca` (subject: “Ticket Pulse delivery test to Susan (QA 07-16 item 2)”, from `ticketpulse@bgcengineering.ca`, with Vahid CC’d as a control). Please tell us whether it arrived in your **Inbox**, **Junk**, or **not at all**, and roughly when you checked. That single data point tells us whether it’s a delivery/quarantine issue on your mailbox versus a suppression at the provider — and points us at the exact fix (an Exchange transport rule, an allow-list entry, or removing the address from SendGrid’s suppression list).

As a durable improvement we’re also planning to surface the send status (sent / bounced) right on the approval card so this is visible without a back-channel investigation.

3 Tasks tab — built and shipped

You asked: add a “Tasks” tab for assigning tasks to tickets, assign a specific agent, and notify them — comprehensively, for both TP-native (with FS write-back) and FS-native tickets. *(You gave the go-ahead on the plan, so we built it.)*

Every ticket now has a **Tasks tab** (with an open-count badge). Add a task, assign it to an agent, set a due date, and choose whether to notify the assignee. Mark tasks **Start** → **Finish**, reassign, or delete inline.

The screenshot shows the 'Tasks' tab interface. At the top, there's a checkbox labeled 'Tasks' with the text 'Assign discrete tasks to agents on this ticket.' Below this, there's a list of tasks. Each task has a radio button for status (Open or Closed), a label, a status badge (Open or Closed), an assignee (Reza Zaim or Unassigned), and a 'Start' dropdown menu. At the bottom, there's a form to add a new task with a text input 'Add a task...', a dropdown for assignee (Unassigned), a date input 'mm/dd/yyyy', and a '+ Add' button. There's also a checkbox 'Email the assignee that they were assigned'.

The Tasks tab: assignable tasks with status, owner, due date, and a notify toggle.

It's **origin-aware**, exactly as designed:

- **Ticket Pulse tickets** own their tasks here. When the ticket is mirrored to FreshService and the assignee has a FreshService seat, the task is written to the FreshService copy too, so a coordinator watching FreshService sees the same list. We email the assignee ourselves.
- **FreshService tickets** proxy straight to FreshService's own Tasks API — FreshService owns the task and sends the assignee's email natively (so there's no double-send).
- **Local (non-FreshService) agents** can still be assigned a task; it just stays Ticket-Pulse-only, since FreshService has no seat to notify.

To try it: open any ticket → **Tasks** tab → type a task, pick an assignee and due date, Add. On a FreshService ticket you'll see the same tasks appear in FreshService; on a Ticket Pulse ticket the assignee gets an email from Ticket Pulse.

4 Parent / child tickets — built (the recommended approach)

You asked: mark tickets as children, associate them with a parent, assign children to different agents. *(You chose our recommended Option A, so we built it.)*

A new **Parent / child** card sits in the ticket sidebar. Set a parent, or add children — each child is a **real, independently-assigned ticket** (its own status, owner, everything), which is what you wanted for “assign children to different agents”.

 PARENT / CHILD

 Set a parent ticket

Children (1)

#233398 QA TEST - Merg... Susan Xu Open ×

 Add a child ticket

Verified against your tickets: FreshService #233398 linked as a child of TP-1029, keeping its own assignee.

A few things worth knowing:

- **Any ticket can be a child** — Ticket Pulse or FreshService. The relationship is recorded in Ticket Pulse, and we drop a note on the FreshService copies so it's visible there too.
- **Guardrails:** a ticket can have only one parent, and you can't create a loop (making a ticket a child of its own descendant is blocked).
- **On FreshService's side:** as we flagged, FreshService doesn't expose a writable parent/child field on their API for our plan, so the link lives in Ticket Pulse and shows in FreshService as a note rather than a native hierarchy. If a native two-way link ever matters, it's worth asking FreshService whether a higher plan exposes that API — but Option A gives you the assignable-children workflow today.

5 You can now merge a FreshService ticket into a Ticket Pulse ticket

You asked: I can't merge a Ticket Pulse ticket with a FreshService ticket (233398 and TP-1029 are identical), and the merge search couldn't find it.

Two problems, both fixed:

- **The search now finds FreshService tickets.** The merge dialog was hard-filtered to Ticket-Pulse-born tickets only, so FS-born #233398 never appeared. That filter is gone for the tickets you're folding *in* — search by the FreshService number (`233398` or `#233398`) and it shows up with a green **FreshService** badge.
- **The merge itself now works cross-origin.** Selecting the FS-born ticket copies its whole conversation into your Ticket Pulse ticket and then **closes the FreshService ticket with a pointer note** back to the surviving ticket. (The surviving ticket must still be a Ticket Pulse ticket — FreshService owns the conversation on its own tickets, so that direction stays in FreshService, as before.)

Verified against your real tickets: searching 233398 on TP-1029 surfaces FS #233398 with the FreshService badge, ready to fold in.

To retest: open TP-1029 → Merge → type `233398` in the search → check the FreshService row → keep TP-1029 as the survivor → Merge. The conversation lands on TP-1029 and #233398 closes in FreshService with a note pointing to TP-1029.

On the “82% similar” search: the automatic look-alike suggestions only surface open tickets, and only rank duplicates above ~70% similarity. If a candidate doesn't appear as a suggestion, the manual search box below it now finds any open ticket by number or subject — including FreshService ones.

+ Also shipped this week — Custom Agent Alerts

From agent feedback: agents want to “follow” certain categories (e.g. Licensing) or tags and be alerted when tickets come in — with a choice of triggers and delivery methods, and without getting buried when a burst of similar tickets lands at once.

This wasn't on the July 16 list, but it shipped alongside it and we want QA aware of it. Every agent can now build their own **alert subscriptions** from their portal — **My Competencies** → **My Alerts**.

☐ is re-categorized into scope

Deliver via

☒ Email

☐ SMS

☐ WhatsApp

☐ Phone call

Name (optional)

e.g. Licensing escalations

Create alert

Cancel

☐ Quiet hours

Alerts cover any matching ticket in your workspace, not just ones assigned to you.

The My Alerts tab: each subscription matches on category/tag/priority, fires on the triggers you pick, and delivers by the channels you choose.

Each subscription lets an agent:

- **Match** on a category or subcategory, a tag, and/or a minimum priority (High+ or Urgent-only) — combined.
- **Trigger** when a matching ticket **arrives (new)**, is **escalated** (priority raised into scope), or is **re-categorized** into scope.
- **Deliver** by Email, SMS, WhatsApp, or Phone call. (The phone channels reuse a verified number from the Notifications tab; unverified channels are greyed out with a hint.)
- **Cover the whole workspace** — any matching ticket, not just tickets assigned to that agent.

Alert-storm protection (built in): when a burst of similar tickets lands at once — say ten Licensing tickets in a minute — the agent gets **one grouped alert** ("10 new tickets in Licensing"), not ten separate ones. The same ticket never alerts twice for the same trigger. A side effect of the grouping is a short, deliberate delay: a single ticket alerts within about a minute rather than instantly. There's also an optional per-agent **quiet-hours** window that holds non-urgent alerts until it ends (Urgent can be let through).

To test it: a full, self-contained QA script ships with the build — `qa/Custom Agent Alerts - Test Plan.md` — walking through creating a subscription, the new-ticket alert, the storm-grouping test, escalation, re-categorization, the priority filter, other channels, quiet hours, and pause/edit/delete. Quick start: log in as an agent → **My Alerts** → **Add an alert** → pick a category you can generate test tickets for → create a QA TEST ticket in it → you should get one email within ~30–60s.
