

QA Test Plan — Features Request 07-27 & 07-28

Board view · External-sender flag · Team Balance fix · Mirroring fix · Assignment panel redesign · + Suggestions for the team

Prepared for the QA team · v3.0.79-preview · Test cycle 2026-07-29

Ticket Pulse — QA Test Plan (2026-07-29)

Tester: _____ Date: _____ Device / browser: _____

This round covers **Features Request 07-27** (4 items) and **07-28** (3 items), plus a **Suggestions & Improvements** section at the end for the team to assess and respond to. ☐ = tick the box; ☒ = expected result.

Before you start: hard-refresh once (Ctrl/Cmd-Shift-R) so you're not testing a cached bundle — the Board view and Assignment panel need the new build.

What changed this build

Req	Reported	Shipped
07-27 #1	Team Balance counted Pending as Open (74 "open" = 15 open + 59 pending)	Open and Pending are separate series; distribution table gains Pending Now ; load badges use the true combined queue
07-27 #2	"Should we combine Resolved with Closed?"	Answered + partially consolidated — decision & reasoning in §2, with a response box for the team
07-27 #3	List vs card view, drag-and-drop status columns	New Board view: Open / Pending / Closed columns, drag cards to change status (origin-aware)
07-27 #4	Flag tickets from non-BGC senders; multiple domains per workspace	Amber External badge driven by a per-workspace Trusted domains list (Settings → Ticket Ops)
07-27 #5	Noise dismissal changed a Closed ticket to Resolved	An agent's Closed status is preserved; the noise note still lands
07-28 #1	Command palette titles don't match the tabs	Palette, side rail, and page titles agree: Analytics · Assignment · Agent Maps (+ person-with-check icon)
07-28 #2	TP-1058 wouldn't mirror — "Freshservice API error: validation error"	Root cause: FreshService made Department required on create. Mirrors now resolve it automatically; errors show field-level detail
07-28 #3	"What does Today PT mean?" — make the auto-assign panel 200% better	Redesigned: explicit date/timezone, automation rate , outcome-mix bar, freshness + after-hours chips

Fast-pass smoke check (≈8 min)

- ☐ **Board view:** Tickets → toggle shows **Compact / Roomy / Board**; Board shows 3 columns of cards (§3)
- ☐ **Drag-drop:** a TP-born card dragged Open → Pending changes status with an undo toast (§3)
- ☐ **Team Balance:** Workload by Agent has separate **Open now** and **Pending now** bars (§1)

- ☐ **External badge:** with your domain in Trusted domains, an outside-sender ticket shows the amber **External** chip (§4)
- ☐ **Mirror:** TP-1058 shows **Mirrored**; a fresh TP-born test ticket mirrors within ~1 min (§6)
- ☐ **Assignment panel:** the caught-up hero shows a real date + "Pacific Time · since midnight", not "TODAY PT" (§7)
- ☐ **Palette:** Ctrl+K entries read **Analytics**, **Assignment** (person-with-check), **Agent Maps** (§5)

Smoke result: ☐ **Pass** ☐ **Fail** — Notes: _____

1 Team Balance: Open vs Pending split (07-27 #1)

1. **Analytics** → **Team Balance** (IT). ✓ **Workload by Agent** now has four series — *Assigned*, **Open now**, **Pending now** (violet), *Closed / resolved* — with exact per-series hover counts.
2. Cross-check an agent with a big pending queue (e.g. Alexey): ✓ "Open now" = truly Open only; Open + Pending together equal the old inflated number.
3. **Team-Safe Distribution:** ✓ new **Pending Now** column; mobile cards read "N open · M pending".
4. ✓ The **20+ in queue (open + pending)** filter and High/Watch/OK badges consider the combined queue (5 open + 25 pending still flags).
5. ✓ CSV/XLSX export includes a **Pending Now** column.

Result: ☐ **Pass** ☐ **Fail** — Notes: _____

2 Resolved vs Closed — the decision (07-27 #2)

Decision: keep both statuses in the data, consolidate where you look at them.

- **FreshService itself distinguishes them** (Resolved = agent finished, awaiting requester confirmation; Closed = final). Sync would re-introduce the distinction on every FS-born ticket, and the public status page + audit history rely on the exact value.
- **Every aggregate already merges them** — the queue's "Resolved" segment, dashboards, analytics closed counts, SLA/CSAT logic all treat Resolved+Closed as one terminal bucket. The redundancy is mostly in pickers, where the distinction is occasionally useful.
- **Consolidated now:** the new Board's single **Closed** column holds both (resolved cards keep a small tag).
 1. Board view: ✓ resolved and closed tickets share the **Closed** column; resolved ones carry a small emerald **Resolved** tag.
 2. ✓ Status filter and Status picker still offer all four statuses (intentional).

Team response — agree with keeping both? ☐ **Agree** ☐ **Prefer full merge** — Notes: _____

3 Tickets Board view with drag-drop (07-27 #3)

1. **Tickets** (desktop) → view toggle: ✓ third option **Board**.
2. ✓ Three columns — **Open / Pending / Closed** — with counts; cards show ref, type, subject, assignee, priority, SLA chip (Open cards).
3. ✓ The board loads **all statuses** even though the list default is Open+Pending.
4. Drag a **TP-born** card (TP-####) Open → Pending: ✓ card moves, undo toast appears ("TP-#### → Pending"), change survives refresh, undo works.
5. Drag an **FS-born** card (#123456): ✓ the FreshService write-back **confirm dialog** appears first; cancel leaves it untouched.
6. ✓ Read-only cards show a small **lock** and refuse to drag (hover the lock for the reason).

7. ✓ Single-click still opens the **peek preview**; double-click opens the full ticket. Compact/Roomy unchanged; the choice persists.

Result: ☐ **Pass** ☐ **Fail** — Notes: _____

4 External-requester flag + Trusted domains (07-27 #4)

1. **Settings** → **Ticket Ops** → **Trusted domains** (new card): add `bgcengineering.ca` (an email or @-form also works — it normalizes). ✓ chip renders; remove works; **Saved** appears.
2. **Tickets**: ✓ outside-sender tickets (e.g. `notifications@app.bamboohr.com`) show an amber **External** chip; internal senders show nothing.
3. ✓ Same badge in the **peek preview** and **ticket detail** headers.
4. ✓ Subdomains of a trusted domain are trusted (`mail.bgcengineering.ca` is not flagged).
5. ✓ Emptying the list turns the badge off everywhere; the list is **per-workspace**.

The badge means "sender outside your org" — a triage caution, not a malware verdict.

Result: ☐ **Pass** ☐ **Fail** — Notes: _____

5 Command palette naming (07-28 #1)

1. Press **Ctrl+K**: ✓ entries read **Analytics**, **Assignment** (person-with-checkmark icon), **Agent Maps**.
2. ✓ The side rail shows **Agent Maps** and the page header says **Agent Maps** — palette, rail, and page agree.

Result: ☐ **Pass** ☐ **Fail** — Notes: _____

6 Ticket mirroring fixed (07-28 #2 — TP-1058)

What was wrong: FreshService (our tenant) recently made **Department a required field** on ticket creation. The mirror never sent one, so every new mirror failed with an opaque "Validation failed" — TP-1058 retried 8 times and dead-lettered. Mirrors now resolve the department automatically (ticket department → requester office/department → fallback), and mirror errors surface FreshService's **field-level** details.

1. Open **TP-1058**: ✓ chip reads **Mirrored** (re-queued after deploy) and the FreshService copy exists.
2. Create a TP-born test ticket ("QA TEST mirror check"): ✓ within ~1 minute the chip goes Mirror pending → **Mirrored**.
3. (If a mirror ever fails now) ✓ the error names the **specific field** FreshService rejected.

Result: ☐ **Pass** ☐ **Fail** — Notes: _____

7 Assignment "all caught up" panel (07-28 #3)

1. **Assignment** with auto-assign on and an empty queue. ✓ "TODAY PT" is gone; the hero shows:
 - **"Pipeline activity — <Weekday, Month Day>"** with **"Pacific Time · since midnight"** beneath (hover explains the window);
 - **tickets analyzed** and the **"fully automatic" rate** (share of decided tickets routed with no human touch);
 - an **outcome-mix bar** whose colors match the four tiles below (hover segments for counts);
 - **"Last auto-assignment X min ago → tech"**;
 - outside business hours: **"After hours — resumes <window>"** with the queued count.
2. ✓ The four outcome tiles + process pills still drill into their sub-tabs with matching counts.

8 Regression guard: noise dismissal vs Closed (07-27 #5)

1. Close a QA TEST ticket, then dismiss it as noise. ✓ It **stays Closed** — no flip to Resolved; the noise note still lands.
2. ✓ A ticket dismissed while still Open resolves as before (unchanged).

Result: ☐ Pass ☐ Fail — Notes: _____

Suggestions & improvements — for the team to assess

Researched against current service-desk practice. Useful benchmarks: mature AI-triage teams reach **60–70% automation** and target **90–95% routing accuracy**; assisted teams roughly halve triage time. Please mark a verdict on each so we can plan the next cycles.

#	Suggestion	Why / what it builds on	Team verdict
S1	SLA breach-risk lane — a queue segment for tickets <i>predicted</i> to breach (aging + no first reply + priority) before they do	We already track SLA due dates and pause logic; peers (Jira SM) surface "SLA risk" natively	☐ Want ☐ Later ☐ Skip
S2	Routing-accuracy metric — weekly % of auto-assignments that stuck (vs reassigned within N days) on Automation Ops	Industry target 90–95%; we already record assignment episodes + corrections — measurable today	☐ Want ☐ Later ☐ Skip
S3	Auto-resolution for repetitive requests — confidence-gated replies that also <i>resolve</i> (e.g. password-reset guidance)	We already have AI proposed-replies with confidence gates; leading stacks auto-resolve 60%+ of L1 volume	☐ Want ☐ Later ☐ Skip
S4	Microsoft Teams surface — approvals, "my ticket" status, and urgent alerts inside Teams	Requesters already create tickets via Teams; 2026 stacks live where users are	☐ Want ☐ Later ☐ Skip
S5	Knowledge-article suggestions on tickets, beside the related-tickets card	We suggest related tickets; suggesting the <i>answer</i> shortens handle time	☐ Want ☐ Later ☐ Skip
S6	Requester self-service deflection — a small FAQ/status step before "create ticket" on public pages	Deflection is the cheapest ticket you never get; the public token pages already exist	☐ Want ☐ Later ☐ Skip
S7	Correction feedback loop — one-click "why" when a coordinator overrides an AI assignment, feeding the competency model	Best practice: overrides feed the model; we capture corrections but not the reason	☐ Want ☐ Later ☐ Skip
S8	External-sender automation — a workflow condition "requester is external" for routing/priority rules	Builds directly on this build's External flag; small follow-up	☐ Want ☐ Later ☐ Skip

Notes for QA

- Hard-refresh before testing; the Board view needs the new bundle.
- Please report: a board drag that saves without the FS confirm on an FS-born ticket; an External badge on an internal sender (or vice versa); a Team Balance number that disagrees with the technician page; a TP-born ticket stuck on Mirror pending > 5 minutes.
- The trusted-domains list is workspace-scoped — set it up in each workspace you test.
