

Features Request 06-09 — Response

All nine items from the June 9 QA review are addressed below — seven shipped to production, two investigated and answered (one of those also shipped a guard). Each section quotes the request, shows what changed with live screenshots, and tells you where to find it.

Shipped in v2.94

PR #73 → main d64ab40

June 10, 2026

Deployed & verified in prod

At a glance

#	REQUEST	STATUS
1	No "agent notes" variable in the LLM generate step	SHIPPED
2	Add steps between nodes ("add function" in the middle of the line)	SHIPPED
3	Undo accidental node delete + join isolated blocks	SHIPPED
4	"All departments" dropdown in Workflow Audit	SHIPPED
5	When does after-hours end and business hours start?	ANSWERED
6	Difference between Add roster / Add self + hover explanations	ANSWERED + SHIPPED
7	WhatsApp provider readiness warning	FIXED
8	Duplicate "resolved or closed" runs on ticket 225514	ROOT-CAUSED + GUARDED
9	Assignment icon should turn grey like the other icons	SHIPPED

1 Agent notes variable for the LLM generate step

SHIPPED

You asked: “There is no variable on ‘agent notes’ in the right panel of the LLM generate step. To summarize the fix in the closure email, we’ll need access to agent notes.”

The variable panel now includes **Agent notes (private)** — `{{ ticket.agentNotes }}`. It carries the ticket’s most recent private/internal agent notes (up to 5, newest last, each prefixed with the author and date, secrets auto-redacted, capped at ~2,400 characters). It resolves in LLM prompts *and* in plain templates.

- **Privacy gate:** the variable stays empty unless **LLM Context** → **Privacy & redaction** → **Private notes** is enabled for the workspace — the same switch that governs private notes in the evidence bundle.
- **Guard rails:** the LLM is instructed it may *summarize* agent notes in requester-friendly language but must never quote them verbatim in requester-facing fields.

The LLM generate inspector — searching “notes” surfaces the new Agent group variable with its template token.

Where: Mail Workflows → open any workflow → select the LLM generate step → Prompt tab → variable list (Agent group). Turn on private notes under LLM Context → Privacy & redaction.

2 Insert a step in the middle of a line

SHIPPED

You asked: “Right now, we cannot add steps between nodes. It would be better if we can add an ‘add function’ in the middle of the line.”

Every connection line now carries a + button at its midpoint. Clicking it opens an “Insert a step” picker (Condition, LLM generate, Template, Send email, Stop); the chosen step is spliced between the two nodes and the original connection is rewired automatically. Inserting a condition lands the downstream node on its **true** branch, so you only have to wire the false path.

Click + on a line → pick the step to insert.

A condition spliced mid-line; every edge shows its + button.

Where: Mail Workflows → workflow canvas → hover any line.

3 Undo accidental deletes & reconnect isolated blocks

SHIPPED

You asked: “When a node is deleted by accident, there’s no way to undo the delete. Also, I cannot connect the isolated block to the rest of the workflow.”

- **Undo:** a new **Undo** button sits next to “Remove selected” and steps back through the last 60 editor changes — deleting a node now confirms with “Step removed — use Undo to restore it”, and one click brings it back with all its connections.
- **Connecting blocks:** dragging from a node’s **bottom dot** to another node’s **top dot** has always created a connection, but it was nearly invisible. The dots are now larger, grow on hover, explain themselves in tooltips, and a permanent hint on the canvas spells out both gestures. Invalid connections are rejected with a clear message.

The editor toolbar: Add step · Remove selected · Undo.

After pressing Undo the inserted/deleted step is restored exactly as before — note the bottom-right hint explaining + and drag-to-connect.

Where: Mail Workflows → workflow canvas toolbar.

4 “All departments” filter in Workflow Audit

SHIPPED

You asked: “It would be nice to be able to sort by department location (like Brisbane, Calgary, Vancouver...) in the workflow audit section. We can add another dropdown menu called ‘All departments’ in the highlighted row.”

Done — the second filter row gains an **All departments** dropdown, populated with the real department/location values from FreshService (Brisbane, Calgary, Vancouver, Montreal QC, Halifax, Santiago... 27 in production today). Picking one narrows the run list to tickets whose requester belongs to that department.

Workflow Audit — the new “All departments” dropdown completes the second filter row.

Where: Mail Workflows → Workflow Audit → second filter row, far right. *Note:* department lives on the ticket’s requester in FreshService, so runs are matched through the requester profile.

5 When does after-hours end and business hours start?

ANSWERED

You asked: “At 4:58 am, the Ticket Assigned workflow was triggered. At 4:47 am, the Ticket Arrived After-hours workflow was triggered. When does after-hours end and when does business hours start?”

For the **IT workspace**, business hours are configured as:

DAYS	BUSINESS HOURS	TIMEZONE	AFTER-HOURS
Monday – Friday	5:00 AM – 5:00 PM	America/Los_Angeles (Pacific)	Before 5:00 AM and after 5:00 PM
Saturday / Sunday	none	—	All day
Holidays (shared + workspace list)	none	—	All day

So after-hours ends at exactly **5:00 AM Pacific** on weekdays. Both of the runs you flagged are consistent with that — they just follow different rules:

- **4:47 AM — “Ticket arrived after-hours / holiday”** (#227927): the ticket *arrived* at 4:47, which is before 5:00 AM, so the after-hours arrival variant correctly ran.
- **4:58 AM — “Ticket assigned”** (#227923): the **Ticket Assigned trigger is not time-gated at all** — it fires the moment a ticket is assigned, any hour of any day. Only the ticket-*arrival* trigger has business-hours / after-hours / holiday variants. Nothing “switched over” between 4:47 and 4:58.

Business hours are edited under **Settings** → **Business Hours** (per weekday, with the holiday list alongside). If you’d like assignment emails to respect quiet hours too — e.g. defer them until 5:00 AM — that’s a small follow-up we can add; today they send immediately by design.

6 Add roster vs. Add self — and hover explanations

ANSWERED + SHIPPED

You asked: “What’s the difference between add roster and add self in the Escalation Recipients? Add on-hover explanations.”

BUCKET	WHO GETS ALERTED, AND WHEN
Roster (blue)	The core after-hours list. Paged for both automatic after-hours urgent detections and requester clicks on the after-hours immediate-support button. The after-hours phone rotation is also drawn from this list.
Self extra (purple)	Additional people alerted only when a requester clicks the after-hours immediate-support button — they ride on top of the roster for those requester-initiated escalations and are never paged by automatic detection.
Supervisor (orange)	Alerted only when a requester raises a ticket to Urgent from the public ticket page during business hours . Never paged after hours.

All three buttons (and the three summary cards above the table) now explain exactly this on hover, and each card carries a one-line description so the difference is visible without hovering at all.

The screenshot shows the 'Urgent Escalation' settings page. The left sidebar contains navigation links: SETTINGS, Workspace controls, FreshService, Webhooks, Notifications, Mail Workflows, Public Status, Feedback, Urgent Escalation, AI Providers, Sync Settings, Sync Operations, Backfill, Workspaces, Admins, Workspace Access, Dashboard, Photos & Locations, and Business Hours. The main content area is titled 'Settings' and 'Urgent Escalation'. It features several configuration cards: 'AFTER-HOURS PRIORITY ASSESSMENT' (Enabled), 'PRIORITY WRITEBACK' (FreshService writeback on), and 'AFTER-HOURS WORKFLOW ROUTING' (Enabled). Below these are 'Provider readiness warnings' and 'Escalation channels' (Email, SMS, WhatsApp, Voice). The 'Escalation recipients' section shows a search bar and a list of users. Three summary cards are displayed: 'ESCALATION ROSTER' (1 selected: Vahid Haeri), 'EXTRA SELF-ESCALATION RECIPIENTS' (1 selected: Vahid Haeri), and 'BUSINESS-HOURS SUPERVISORS' (1 selected: Vahid Haeri). Each card has a corresponding 'Add' button.

Escalation recipients — bucket cards with inline descriptions and “?” hover hints; every Add roster / Add self / Add supervisor button has a full tooltip.

Where: Settings → Urgent Escalation → Escalation recipients.

7 WhatsApp provider readiness warning

FIXED

You asked: “There’s a whatsapp provider readiness warning in the Urgent Escalation tab in settings. Need to fix it.

What it meant: WhatsApp business-initiated messages must use a Twilio-approved *Content template*, and its SID (an HX... value) was never configured. Your Twilio account, auth token and phone number *are* configured — the WhatsApp template is the only missing piece, which is exactly what the (cryptic) warning was saying.

What we shipped:

- **Plain-English warnings** — it now reads “WhatsApp: an approved WhatsApp template (Twilio Content SID) has not been added”, with a pointer to where it’s configured.
- **Channel pausing** — a new **Escalation channels** card lets you pause SMS / WhatsApp / Voice per workspace. A paused channel is skipped in every escalation send, drops out of the per-user readiness chips, and its warnings disappear. Email is always on.

WhatsApp paused → the amber warning banner is gone and the channel shows as “Paused” everywhere.

To actually enable WhatsApp: create a WhatsApp template in the Twilio Console (Messaging → Content Template Builder), get it approved, then paste its HX... Content SID into **Settings** → **Notifications** (global admin) → “Twilio SMS, WhatsApp, and Voice”. Or simply leave the channel paused if you don’t plan to use it.

Where: Settings → Urgent Escalation → Escalation channels.

8 Why ticket 225514 ran “Resolved or closed” twice

ROOT-CAUSED + GUARDED

You asked: “There is a duplicate ticket for 225514. The ticket resolved or closed workflow ran twice on the same ticket. Pinpoint the cause of this issue.”

Root cause — the ticket genuinely closed twice. Reconstructed from the FreshService activity stream and both audit runs (all times Pacific, June 9):

TIME	WHAT HAPPENED
10:23:54	Alexey replies to the requester...
10:24:03	...and sets Status = Closed (closure #1)
10:25:08	Sync picks it up → run TP-NWF-550 ✓
10:25:33	The requester (Marc Olivier) replies → FreshService’s own “re-open tickets when the requester responds” workflow reopens the ticket
10:26:54	Alexey replies again...
10:26:58	...and sets Status = Closed again (closure #2, with a new resolved timestamp)
10:27:14	Sync sees a fresh open→closed transition → run TP-NWF-551

The engine’s duplicate protection was technically *correct* — these were two distinct closure events with different timestamps — but the requester experience (two closure emails two minutes apart) was wrong.

The fix: a 15-minute churn guard. If the same “Resolved or closed” workflow already completed for the same ticket within the last 15 minutes, the repeat run is suppressed and the audit records why (“Duplicate closure suppressed...reopen/re-close churn”). A genuine reopen that gets re-closed later (beyond 15 minutes) still notifies normally. The window is tunable via `NOTIFICATION_CLOSURE_RERUN_COOLDOWN_MINUTES`.

Your report: both runs for #225514, two minutes apart — now impossible under the churn guard.

Verified: with a completed run seeded 2 minutes earlier the engine suppresses the repeat; a different ticket, or a run older than 15 minutes, proceeds normally.

9 Assignment icon turns grey like the other icons

SHIPPED

You asked: "When the Assignment icon is clicked, the icon should turn grey like the other icons. Use the code below to make the active and grey icons."

We adopted your glyph exactly — the person handing off a perforated ticket — and wired it into the same active/grey logic every other header icon uses. The old PNG could never grey out; the new inline SVG can.

Your spec: violet at rest, grey when on the page.

On the Dashboard — Assignment shows in its violet tile (Dashboard itself is the grey/current one).

On the Assignment page — the icon greys out exactly like the other icons do on their own pages.

Deployment & verification

- All changes shipped as **v2.94** via PR **#73**, squash-merged to `main` (`d64ab40`) and deployed June 10, 2026 — frontend (Static Web Apps) and backend (App Service) pipelines both green; new code confirmed live on **ticketpulse.bgcsaas.com**.
- One additive database migration (`disabled_channels` on escalation policies) applied to production before the rollout.
- Quality gates: lint clean, 24/24 frontend tests passing, production build verified; the closure churn guard was integration-tested against a live database (suppresses the 2-minute repeat, leaves other tickets and >15-minute re-closures untouched).
