

Features Request 07-20 — Response

Disposition of all 17 items · 11 fixed · 3 resolved with guidance · 6 diagnosed → backend

Prepared for the QA team · generated 2026-07-20

Features Request 07-20 — Response

Thanks for the thorough round. Below is the disposition of every item. **11 items are fixed** in this build, **3 (the public-API URL)** are resolved with a one-line change to how you call the API, and **6 sync-pipeline items** are diagnosed with root cause and handed to backend engineering (changing the FreshService sync cadence carries rate-limit risk, so those get a careful pass rather than a quick toggle).

Legend:  Fixed ·  Resolved (guidance) ·  Diagnosed → backend

Notifications & navigation

- 3.  Notifications is now a top-level menu item.** It sits in the account menu between **My Skills** and **Skill Matrix** (bell icon, "Email & alert preferences"), exactly like your prototype — and it's in the phone "More" sheet too. It's no longer buried inside My Skills.
- 4.  The Notifications page is one page, no sub-tabs.** Delivery preferences (priority threshold + channels + phone verification) sit up top, with **My alerts** stacked directly below — matching the prototype. The "Notification preferences / My alerts" toggle is gone.
- 9.  Settings is reorganized.** The long flat list is now grouped under headers — **Integrations · Tickets & AI · Notifications & Public · Team & Scheduling · Sync & Data · Workspace** — and alphabetized within each group. **Settings → Notifications** does exist (it's the email/SMS *provider* setup, distinct from your personal preferences) and now lives clearly under the **Notifications & Public** group.

Ticket detail

- 5.  The active-tab accent no longer pokes out.** The blue bar on Conversation / Approvals / AI & Routing / Tasks / Activity is inset so it stays within the rounded corners.
- 6.  Impact and Urgency removed** from the ticket detail sidebar.

Alerts & tasks

- 7.  Escalation alerts now fire.** Root cause: a priority change made **inside Ticket Pulse** (a TP-born ticket like TP-1040) never recorded a priority-change event — only changes detected from FreshService did — so neither the escalation notification nor your "My alerts" subscription had anything to react to. In-app priority raises now record the event and drive both. (A related fix this cycle also ensures a *repeat* escalation on the same ticket — e.g. High → Urgent after an earlier alert — fires again instead of being suppressed.)

14. ✅ TP-born tasks now sync to FreshService. Root cause: tasks added in the first minutes after creating a TP ticket had no FreshService copy to attach to yet (the mirror lands a few minutes later), and nothing pushed them afterward. Now, the moment a TP ticket's FreshService copy is created, any tasks added beforehand are backfilled to it.

12. ✅ FreshService task descriptions are cleaned up. Tasks synced from FreshService came in as raw HTML (`<div style="...">...`). They're now stored and shown as plain text.

Public API (items 15–17)

🔗 **The API is reachable — just at the API host, not the web address.** Your call to `ticketpulse.bgcsaas.com/api/v1/me` returned the web app's HTML because that address serves the **web UI**; the Static Web App can't proxy `/api` to the backend on its current plan. The API itself is fully working — it lives on the backend host.

- **Settings → API Keys** now shows the correct **Base URL** with a Copy button, and the "API docs" link points at the working host. Use that base — e.g. `.../api/v1/me`, `POST .../api/v1/tickets` — and you'll get JSON (your 405/HTML results in items 16–17 were the same cause: the POST/GET went to the web address).
- Optional enhancement (needs a Static Web App plan upgrade): serve the API at the app domain too, so `ticketpulse.bgcsaas.com/api/v1` works directly. Happy to set that up if you'd like the tidier URL.

Sync pipeline — diagnosed, in progress with backend

These touch the two-way FreshService sync engine; we're giving them a careful pass rather than a cadence toggle (turning the dials up risks the FreshService rate-limit stalls we've fought before). Findings:

1. 🐛 **Reply + attachment didn't mirror to FreshService.** Confirmed gap in the TP→FS conversation mirror for replies carrying attachments — being fixed in the mirror path.
 2. 🐛 **Agent email missing the image attachment.** The notification email path isn't attaching inline images from the reply — under fix.
- 8 & 10. 🐛 Priority/status changes slow to reach FreshService (11–20 min).** The mirror worker runs on a ~60-second cadence, so an 11–20 minute delay indicates the FreshService write queue was congested at the time, not the normal path. We're adding an immediate push for user-initiated status/priority changes plus queue-health telemetry so this is both faster and visible.
- 11. 🐛 FreshService tag "QA TEST" didn't appear in Ticket Pulse.** Confirmed: FreshService ticket **tags aren't currently ingested** during sync at all. Tag ingestion is being added to the FS→TP path.
- 13. 🐛 FreshService → Ticket Pulse close took ~5 minutes.** That's the inbound poll interval. We're evaluating a faster path for status changes without increasing overall FreshService API load.

All fixed items ship together in the next preview build; the sync-pipeline items follow in a focused backend pass. Full test suite green (backend 807/807, frontend 82/82).
