

Comprehensive QA Test Plan

Mobile overhaul + Features Request 07-20 fixes · Test cycle 2026-07-21

Prepared for the QA team · generated 2026-07-20

Ticket Pulse — QA Test Plan (2026-07-21)

Build under test: next preview build · **Prepared for:** QA team · **From:** Ticket Pulse dev

This round covers two bodies of work landing together:

1. **Mobile overhaul** — the Dashboard, Technician page, ticket queue, and ticket detail were reworked to be genuinely usable on a phone (new features + fixes).
2. **Features Request 07-20 fixes** — the items you reported last round (Notifications restructure, Settings reorg, escalation alerts, ticket-detail tweaks, task sync, API).

How to test: Use a real phone where a section says "mobile", or Chrome DevTools device mode (iPhone/Pixel, ~390px wide). Everything else can be tested on desktop. Use a **QA TEST** prefix on tickets you create and clean them up as usual. Report anything that deviates from the  expected result, with the ticket ref (and, for API items, the `X-Request-Id`).

Not in this build — please don't re-file these yet. The sync-timing and mirror items from 07-20 (#1 reply/attachment mirror, #2 email image attachment, #8/#10 priority/status sync latency, #11 FreshService tags → TP, #13 close latency) are diagnosed and in a separate backend pass. They are **not** in this build.

1. Mobile experience

Test these on a phone (or device mode). The goal: no squeezed desktop layouts, real touch targets, and the things that only worked on desktop now work on mobile.

1.1 Dashboard — technician cards + inline tickets (NEW)

1. Open **Dashboard** on a phone.
2.  Each technician shows as a single-column card sized for a phone (avatar and numbers no longer oversized; no hover-zoom on the photo).
3. On any card, tap **"View tickets (N)"** at the bottom of the card.  The technician's tickets expand **inline, right on the Dashboard** (previously there was no way to see a tech's tickets on mobile). Tapping again collapses them.
4. In that expanded list, tap a ticket reference (e.g. `TP-1042`).  It opens the **in-app ticket page** (`/tickets/...`), not FreshService.
5. Tap the small **hide (eye-off)** control at a card's top-right.  It's tappable on touch (it used to only appear on hover, so phones couldn't reach it).

1.2 Technician (agent) page — mobile

1. From the Dashboard, tap a technician to open their page on a phone.
2. ✅ The header controls (Daily/Weekly/Monthly, date nav, **Export**, **Today**) wrap onto multiple rows and are all reachable — they no longer scroll off a hidden strip.
3. ✅ The metrics ribbon fills cleanly (no orphaned tile); tiles read clearly at phone width.
4. ✅ Ticket rows render as tidy cards (not a squeezed table).

1.3 Ticket queue — live cues on mobile (NEW)

1. Open **Tickets** on a phone.
2. Trigger an AI auto-assignment (or have one land) on a visible ticket. ✅ The assignee cell on the **mobile card** shows the completion "pop" cue when the assignment lands (this previously only fired on desktop).
3. If your device has **Reduce Motion** on (Settings → Accessibility), create/observe a new or just-updated ticket.
✅ New/updated tickets still show a **static** highlight (a steady tint/left accent) — the cue no longer silently disappears under reduced motion.

1.4 Ticket detail — mobile assign + properties (NEW)

1. Open any ticket detail on a phone.
2. ✅ Just under the header (above the conversation) there's a **properties bar** showing the **assignee** and **status** — so you don't scroll the whole thread to see/change them.
3. Tap the assignee in that bar. ✅ A **bottom-sheet assign picker** opens (ranked AI suggestion + one-tap approve, current assignee with Unassign, searchable member list) — the same touch-first sheet as the queue, instead of the cramped desktop popover.
4. Assign someone from the sheet. ✅ It saves and the properties bar updates.

2. Technician page fixes (desktop AND mobile)

These are correctness fixes that apply on any screen.

2.1 Ticket links open in Ticket Pulse (not FreshService)

1. Open a technician page → **Tickets** tab. Also check the **Coverage**, **CSAT**, **Bounced**, and **Feedback** tabs.
2. Click any ticket reference or subject. ✅ It opens the **in-app** ticket page (`/tickets/:id`). FreshService is now only a small secondary "external" icon beside the reference (click it to open FS if needed).

2.2 Overview stat cards are clickable (NEW)

1. On the technician page **Overview** tab, click the ****Open now / Self-picked / Assigned / Closed cards (and Total / Self-pick rate**)**. ✅ Each jumps to the **Tickets** tab pre-filtered to that set (a chevron on the card hints it's clickable).

2.3 Number accuracy

1. Compare **"Assigned"** on the Overview tab vs the Tickets-tab ribbon. ✅ They now agree (Overview previously added app-assignments into "Assigned"; both now count coordinator-assigned, with any app-assigned shown as a separate "+N via app" note).
2. Check the daily **CSAT** count on the CSAT tab against a day you know. ✅ The day boundary now matches the weekly/monthly counts (Pacific time) — no more off-by-one-day mismatch for non-Pacific browsers.

3. Notifications (Features Request 07-20 #3, #4, #7)

3.1 Notifications is a top-level menu item

1. Click your **avatar menu** (top-right). ☒ There's a **Notifications** item (bell, "Email & alert preferences") between **My Skills** and **Skill Matrix** — it's no longer buried inside My Skills.
2. On a phone, open the **More** sheet (bottom bar). ☒ **Notifications** appears there too.
3. Click it. ☒ It lands directly on the Notifications view.

3.2 One Notifications page, no sub-tabs

1. On the Notifications view: ☒ It's a **single page with two stacked sections** — delivery **preferences** (priority threshold + Email/SMS/WhatsApp/Phone channels + phone verification) on top, **My alerts** (your alert subscriptions + Quiet hours) below. The old "Notification preferences / My alerts" sub-tabs are gone.

3.3 Escalation alerts fire on an in-app priority raise (FIX)

1. As an agent, add a **My alerts** subscription with **"is escalated"** on, matching a category you can generate a test ticket for.
2. Create a **QA TEST** ticket in that category, then **raise its priority in Ticket Pulse** (e.g. Medium → High, then High → Urgent). ☒ You receive an escalation alert (previously, priority changes made *inside* Ticket Pulse didn't fire any alert — only changes made in FreshService did).
3. ☒ The second raise (High → Urgent) alerts again — a repeat escalation on the same ticket isn't suppressed.

4. Settings reorganization (Features Request 07-20 #9)

1. Open **Settings** (as an admin). ☒ The left nav is now grouped under headers — ****Integrations · Tickets & AI · Notifications & Public · Team & Scheduling · Sync & Data · Workspace**** — and items are alphabetical within each group.
2. Find **Notifications** (the email/SMS provider setup). ☒ It's under the **Notifications & Public** group — easy to locate now. (This is the provider config, distinct from your personal Notifications page in §3.)

5. Ticket detail tweaks (Features Request 07-20 #5, #6)

5.1 Tab accent

1. On a ticket, look at the active tab's blue top accent (Conversation / Approvals / AI & Routing / Tasks / Activity). ☒ The blue bar sits **inside** the rounded tab corners — it no longer pokes out past them.

5.2 Impact / Urgency removed

1. Open a ticket's detail sidebar. ☒ **Impact** and **Urgency** fields are gone.

6. Tasks & FreshService (Features Request 07-20 #12, #14)

6.1 FreshService task descriptions are clean

1. On a **FreshService-born** ticket that has tasks (or add a task in FS with a description), open the ticket's **Tasks** tab in Ticket Pulse. ☒ The task description shows as **plain text** — no more raw HTML / `<div style=...` markup.

6.2 TP-born tasks sync to FreshService (FIX)

1. Create a **QA TEST** ticket in Ticket Pulse (native ticketing workspace) and ****immediately add 1–2 tasks**** to it (before its FreshService copy has been created).
2. Wait for the ticket to mirror to FreshService (~a few minutes), then open the FS copy. ☒ The tasks you added are now present on the FreshService ticket (previously, tasks added before the mirror existed were never pushed).
3. Add another task **after** the ticket is mirrored. ☒ It appears in FreshService too.

7. Public API — base URL (Features Request 07-20 #15-17)

1. Open **Settings** → **API Keys**. ☒ A **Base URL** is shown with a **Copy** button, and a note that the app domain serves the web UI, not the API. The "API docs" link points at the API host.
2. Create a **Live** key with `tickets:read` (and copy it), then call the API using the **Base URL shown on that page** (not the web address):

`` `curl <BASE_URL>/me -H "Authorization: Bearer tp_live_..."` `` ☒ Returns **JSON** (your key name, workspace, scopes) — not the HTML web page.

1. `GET <BASE_URL>/tickets` ☒ returns JSON. `POST <BASE_URL>/tickets` with a body ☒ creates a ticket (no more 405/HTML — those happened because the earlier calls went to the web address instead of the API host).

Notes for QA

- **Reduced Motion:** several live cues have static fallbacks now — if your test device runs

Reduce Motion, expect steady highlights rather than animations (that's intended).

- **Origin matters:** "TP-born" = created in Ticket Pulse (fully editable, mirrored to FS);

"FS-born" = created in FreshService (read-mostly). Test steps call out which is needed.

- Please report: any ticket link that still opens FreshService instead of the in-app page;

any stat card that isn't clickable; a mobile layout that squeezes or hides content; an escalation alert that doesn't arrive; or an API call to the shown Base URL that returns HTML instead of JSON.
