

Features Request 07-17 — Response

Every item from the July 17 review is addressed. The headline: **the missing emails were a single root cause** — SendGrid was silently blocking our production server — and that's now fixed and monitored. The rest were task and naming improvements, which are built and shipped. Two items are FreshService platform limits we explain below.

Shipped in v3.0.69-preview

July 18, 2026

Deployed & verified in prod

At a glance

#	YOUR REPORT	STATUS
1	Approval email still not received	FIXED · EMAIL
2	Task-assignment email not received ("fix one, fix all")	FIXED · EMAIL
3	Task fields need labels (Task Description, Due Date)	SHIPPED
4	Task status dropdown + editable description + log to activity	SHIPPED
5	"History" vs "Activity" naming inconsistency	SHIPPED
6	Merge: can't pick 233398 as survivor; requester emails missing	BY DESIGN + FIXED
7	Task completion status doesn't sync TP ↔ FreshService	SHIPPED
8	Agent alerts shouldn't sit under My Skills; merge with Notifications	SHIPPED
9	My Alerts high-priority test: got call + SMS, no email	FIXED · EMAIL
10	Urgent procurement/licensing ticket: got call + SMS, no email	FIXED · EMAIL
11	Parent/child link doesn't sync to/from FreshService	FS LIMITATION

★ The missing emails — one root cause, now fixed (items 1, 2, 6, 9, 10)

You reported, repeatedly: approval emails, the task-assignment email, the merge “email each requester”, and the My Alerts / urgent-ticket emails all didn’t arrive — even though the phone call and SMS did. You noted “fix one, fix all,” and you were exactly right.

What was actually happening. Every email flows through SendGrid. SendGrid has an **IP Access Management** allowlist — a list of server IP addresses permitted to send. Our production server runs on Azure, which doesn’t use one fixed outbound IP: it rotates through a **pool of ~30 addresses**, and that pool shifts whenever the service scales. At some point production started sending from an address that wasn’t on the allowlist, and SendGrid **silently rejected every send** (a 403 “access forbidden”). SMS, WhatsApp, and phone calls go through a different provider (Twilio) with no such allowlist — which is exactly why those kept working while email went dark. That single mismatch explains all five email reports at once.

How we proved it. We confirmed the same SendGrid key sends fine from our office network (a 202 “accepted”), used the identical key, sender, and message from production, and the only thing that differed was the source IP. We then reproduced the block from inside the production server. The allowlist has been **removed** for this send-only key, and a live test from production now succeeds.

So it never hides again. The reason this was painful is that a failed send was swallowed silently — nothing in the app said “email is failing.” We closed that gap: Ticket Pulse now checks **every** outbound email and shows the result in **Settings** → **Notifications** → **“Email delivery health”** (status, last successful send, recent failures, and a plain-English fix hint). If delivery ever breaks again, admins get an in-app banner immediately instead of finding out from missing mail.

Please re-test (all should now email you): (1) an approval with “email approver”; (2) assign a task to yourself with notify on; (3) a merge with “email each requester”; (4) a My Alerts trigger; (5) an urgent ticket in a watched category. If any email still doesn’t arrive, check the new health card and tell us what it says — it will point straight at the cause.

4 Tasks: status dropdown, editable description, and an activity trail

You asked: FreshService lets tasks have a status and be edited — Ticket Pulse was missing both. Add a status dropdown, let the task description be edited by anyone, and when the status changes, record it in the activity tab.

All three are in:

- **Status dropdown** — every task now has an **Open / In progress / Done** dropdown (the quick “tick to complete” circle stays for convenience).
- **Editable description** — a pencil icon on any task lets anyone edit its text inline and save; no more delete-and-recreate.
- **Activity trail** — each status change is written to the ticket’s **Activity** tab (e.g. “Task status changed — Open → Done · Task: <name>”), including changes that come back from FreshService.

To try it: open a ticket → **Tasks** → change a task’s status in the dropdown, and click the pencil to edit its wording. Then open the **Activity** tab and you’ll see the status change logged.

3 Task form fields now have labels

You asked: the add-task fields should have labels — “Task Description” over the text field and “Due Date” over the date picker.

Done — the add row now shows labels above each field: **Task Description**, **Assign To**, and **Due Date**.

5 “History” is now called “Activity” everywhere

You asked: the ticket preview calls it “Activity” but the details page calls it “History” — keep it consistently “Activity”.

The ticket detail tab has been renamed from **History** to **Activity**, matching the preview drawer. Same timeline, one name.

7 Task status now syncs both ways with FreshService

You asked: marking a task done on Ticket Pulse didn’t update FreshService, and vice-versa.

Ticket Pulse → **FreshService** was pushing status changes, but the reverse direction wasn’t wired for Ticket-Pulse-born tickets. Now, when you open a ticket’s Tasks tab, we reconcile task status from the FreshService copy too — so **marking a task done in either place is reflected in the other**, and the change lands on the Activity tab.

One thing worth knowing: the two systems reconcile when the Tasks tab is loaded (not instantaneously across both tools at the same second). Open the tab and the statuses line up.

To try it: mark a task **Done** on FreshService, then open that ticket’s **Tasks** tab in Ticket Pulse — it shows Done. Do the reverse and check FreshService.

8 Notifications and My Alerts are now one tab

You asked: agent alerts under “My Skills” is confusing — combine Notifications and My Alerts into one “Notifications” tab.

Done. In the agent portal there is now a single **Notifications** tab with two sub-sections: **Notification preferences** (how you’re reached) and **My alerts** (which tickets alert you). The separate “My Alerts” tab is gone.

To see it: agent portal → **Notifications** → toggle between “Notification preferences” and “My alerts”.

6 Merge: why 233398 can’t be the survivor (and the requester emails)

You asked: merging TP-1029 and 233398, you couldn’t pick 233398 as the surviving ticket; and “email each requester” didn’t send you the 2 emails you expected.

- **The survivor must be the Ticket Pulse ticket — by design.** #233398 is a FreshService-born ticket, and FreshService owns its conversation and record. Ticket Pulse can fold a FreshService ticket *into* a Ticket Pulse ticket (copying the conversation and closing the FS one with a pointer note), but it can’t take ownership of a FreshService-owned record the other way. So TP-1029 surviving is correct and intended.
- **The missing requester emails were the SendGrid block above.** The “email each requester” step was firing — it just couldn’t deliver while production’s IP was blocked. With email restored, a merge with that option checked will now send. Please re-test.

11 Parent/child links and FreshService — a platform limit

You asked: linking TP-1032 and TP-1033 as parent/child doesn’t update FreshService, and a child linked in FreshService doesn’t appear in Ticket Pulse.

This is a genuine FreshService API limitation rather than a bug on our side. **FreshService doesn't expose a writable parent/child field** on our plan's API, so there's no field for us to set or read. What Ticket Pulse does today:

- The parent/child relationship is stored in Ticket Pulse (each child is a real, independently-assignable ticket), and we drop a **note** on the FreshService copies so the link is at least visible there.
- Because there's no readable native field, a parent/child link created *inside FreshService* can't be pulled back into Ticket Pulse automatically.

If a true two-way native link matters, the path is to confirm with FreshService whether a higher plan tier exposes that association in their API — at which point we can wire it. Until then, manage the hierarchy in Ticket Pulse (where children are fully assignable) and treat the FreshService note as the cross-reference.
